

Week 1: Introduction to Python Programming

Objective

To learn the fundamentals of Python programming, including variables, data types, operators, input/output statements, conditional statements, and loops.

Concepts Learned

- Variables and Data Types
- Arithmetic and Logical Operators
- User Input and Output
- Conditional Statements (if-else)
- Loops (for and while)

Project: Temperature Converter

Developed a Temperature Converter application that converts temperature values between Celsius and Fahrenheit. The program accepts user input, performs the required conversion, and displays the result.

Outcome

Successfully understood the basics of Python programming and applied the concepts to build a simple real-world application. Gained hands-on experience in writing, executing, and debugging Python programs.

Tools Used

- Python
- Visual Studio Code (VS Code)

Conclusion

Week 1 provided a strong foundation in Python programming. The Temperature Converter project helped in understanding how Python can be used to solve practical problems using basic programming concepts.
