

Week 2: Data Structures and Functions

Objective

To learn Python data structures and functions and apply them to perform basic data cleaning operations.

Concepts Learned

- Lists
- Tuples
- Dictionaries
- Sets
- Functions
- Lambda Functions
- List Comprehensions

Project: Data Cleaning Program

Developed a Data Cleaning Program that removes duplicate values from a dataset and filters the required records. The program uses Python data structures and built-in functions to process data efficiently.

Outcome

Successfully learned how to store, organize, and manipulate data using Python data structures. Gained practical experience in data cleaning by removing duplicates and filtering records based on conditions.

Tools Used

- Python
- Visual Studio Code (VS Code)

Conclusion

Week 2 enhanced my understanding of Python data structures and functions. The Data Cleaning project demonstrated how Python can be used to process and clean data effectively, which is an important skill in data analysis and software development.
